

Technical parameter

Annotations

1. The picture shows that the adjusting axle is on the H point;
2. The thermostat's capillary tube and the temperature sensing bulb are easy to damage, They couldn't be damaged/pressed to flat/broke off, or it will influence the thermostat's function and temperature;
3. Thermostat's working temperature is 25°C, the capillary tube must be immersed in heat water of 30~80mm deep, or the testing result will not be correct;
4. Testing condition: the model of temperature variety is $\leq 1^\circ \text{C}/\text{min}$.

- 1.H point temperature/OFF: $0 \pm 20^\circ \text{C}$ DIFF: $8 \pm 5^\circ \text{C}$
- 2.The fixing electric voltage AC250V
The fixing electric current 16A
- 3.Electrical strength: 2000VAC/1min/0.5mA
- 4.The touching electric resistance $< 50 \text{ m}\Omega$
- 5.Insulating electric resistance $> 100 \text{ M}\Omega$
- 6.The highest temperature the main body can endured: 125°C
- 7.The highest temperature the temperature feeling tube can endured: 350°C
- 8.Product's life: > 10 万次
